[Back to Week 3](#)

1. The simple threshold classifier for sentiment analysis (check all that apply):

2. For a linear classifier classifying between "positive" and "negative" sentiment in a review x , $\text{Score}(x) = 0$ implies (check all that apply):

3. For which of the following datasets would a linear classifier perform perfectly?

4. **True or false:** High classification accuracy always indicates a good classifier.

5. **True or false:** For a classifier classifying between 5 classes, there always exists a classifier with accuracy greater than 0.18.

6. **True or false:** A false negative is always worse than a false positive.

7. Which of the following statements are true? (Check all that apply)

Question 5: What is the lack of content-based recommendation systems? We can randomly pick some observations from the dataset and use these observations as initial means. We can create some random dots like cluster centroids. We can select that through correlation analysis. customer churn predictionPrice estimationCustomer segmentationSales forecast Question 4: What approach can be used to calculate dissimilarity of objects in the Ã Ä Minkowski distanceEuclidian distanceCosine similarityAll grouping of objects? Question 5: How is a central point (center of gravity) collected for each cluster in k-means? In the memory-based approach, a recommendation system is created using machine learning techniques such as regression, clustering, classification, etc. In a memory-based approach, a model of users Ã developed in an attempt to learn their preferences. In the memory-based approach. We use the entire set of user data to generate a recommendation system. When we would like to predict the impacts of changes in independent variables on a dependent variable. When there are multiple dependent variables when we would like to identify the strength of the effect that independent variables have on a dependent variable. Question 4: which of the following is true about polynomial regression? Users will only receive recommendations related to their preferences in their profile and the engine board may never recommend any item with other features. As it is based on the similarity between the items and the users, it will not be easy" users close.it Need to find a similar group of users, so suffer from performance drops, simply due to the growth of the similarity calculation. Question 4: what Ã¢ true for KNN KNN DBSCAN can find arbitrary-form clusters.DBSCAN can find a cluster completely surrounded by a different cluster.DBSCAN has a notion of noise, and Ã¢ robust a outliers.Ã Ä DBSCAN does not require specifying the number of clusters as k in k-meansÃ Ä Ä Ä Ä Which of the following is a clustering application? Ã the information that can² decrease the level of certainty after splitting in each node.Ã the entropy of a tree before splitting from an attribute.Ã the amount information disorder, or the amount random in each node.Ã Ä Ä Ä Machine Learning with Python Coursera Quiz Answers Week 4 Question 1: What statement is not true about clustering k-means? Question 1: Supervised learning is about unlabeled data, whereas unsupervised learning is about labeled data. (select all that applies) The probability a person has a heart attack within a specified time period using the age and the person Ã¢s CustomerÃ ¤ Ä ¢s propensity to purchase a product or stop a subscription in marketing applications.Probability of a default home owner on a mortgage.Estimate a patient's blood pressure based on their symptoms and biographical data. Machine Learning with Python Coursera Quiz Answers Week 3 Question 1: What WILL NOT be an example of a classification problem? The difficulty in the recommendation when we do not have enough ratings in the user-item dataset.The difficulty in the recommendation when we have a new user and we cannot profile for him, or when we have not yet obtained any assessment.Ã Ä Ä Ä

example of a classification problem? The difficulty in the recommendation when we do not have enough ratings in the user-item dataset. The difficulty in the recommendation when we have a new user, and we cannot profile for him, or when we have a new item, which has not yet obtained any assessment. A A A The difficulty in the recommendation when the number of users or items increases and the and so the algorithms are going to start to suffer drops. Performance. Question 3: Which of the following examples is / are a sample application of logistics regression? Select all the options of interest. (Select all the appropriate answers) Logistics regression can be used for both the binary binary system and classification multi-class logistics regression is similar to linear regression but takes a categorical / discreet destination field instead of a numeric. In the logistic regression, the dependent variable is binary. Machine Learning with Python Coursera Quiz Answers Week 5 Question 1: What are the benefits of Recommender Systems? Question 5: Which sentence is not true about non-linear regression? Non-linear regression is a method for modeling the non-linear relationship between the dependent variable and a set of independent variables. Because a model is considered non-linear, y must be a non-linear function of the parameters. Non-linear regression must have more than a dependent variable. To predict the category to which a customer belongs. To predict if a customer goes to another supplier / brand. To predict the amount of money that a customer will spend in one year. To predict if a customer responds to a particular advertising campaign or not . no.

is/are the advantage/s of Recommender Systems ? Recommender Systems provide a better experience for the users by giving them a broader exposure to many different products they might be interested in. Here there are 10 Quiz Questions of Coursera week 2 assignment answers are given in a yellow background. 1. Machine learning is an "iterative" process, meaning that an AI team often has to try many ideas before coming up with something that's ... Dec 26, 2019 · Click here to see solutions for all Machine Learning Coursera Assignments. Click here to see more codes for Raspberry Pi 3 and similar Family. Click here to see more codes for NodeMCU ESP8266 and similar Family. Click here to see more codes for Arduino Mega (ATMega 2560) and similar Family. Feel free to ask doubts in the comment section. I will try my best to ... Jul 21, 2021 · Hello Peers, Today we are going to share all week assessment and quizzes answers of Data Visualization With Python the IBM Data Science Professional course launched by Coursera totally free of cost .This is a certification course for every interested student. In case you didn't find this course for free, then you can apply for financial ads to get this course for ...
