Life, Death, and Cancer

The vast majority of people go through life taking things as they are; they seem to never want to know how things work or why something happens the way it does. Think about it, how does a plane fly, or how does an engine run. These innovations were discovered many years ago and took much time and effort to discover and perfect. If a person were to look at the world, there is not much that they could say "I know how this works", rather they say "I [wonder](#) why this happens as it does". Well one of the most important things in the world is medicine, or the medical world. Without the past works of doctors, surgeons, and those who have helped pave the way, the world would be devastated. One of the most important and dangerous areas of surgery is that of the brain. The brain is one of the most complex parts of the body and takes much time and effort to understand. If a part is so complex that it controls actions, thoughts, feelings, contains knowledge and facts, just think about how hard it would be to really understand what this part is capable of doing. Such complex things such as the brain require more effort and time to understand than any [engine](#) or [plane](#) could ever have. Without the dedication that these people had, the information that we have today would never be possible. The technology that was present back in the day was nothing more than steel, a mirror, paper, and a pen. The way that this

information was received is amazing; to just imagine what the possibilities are for the future is going to be outstanding and the risks will become nothing of the past. The past generations have set a standard for excellence and a need of knowledge; what the future holds is even greater. History is one of the most important things in success of surgery but to be better educated on the topic of cancer one must know what cancer is, the types of cancer, and the solutions to eliminate cancer in general.

One of the most exciting things about the discovery brain cancer is the history behind the complex operation. To think that back in the eighteenth century physicians and doctors had the capability to open the human brain and surgically remove the tumor in the brain.
